This document explains the other files in this folder, as well as those on GitHub and their contents. At the bottom of the document, there are additional notes and helpful analogies. The GitHub page used is entitled dparry13/hbll-data_training.

openrefine_setup_sheet_fall_2026.pdf
We printed this sheet right before the workshop. We left it on the attendees' desks so they could set up everything for the workshop without extra instruction. It also includes a common problem that people with Windows computers experienced and how to bypass it.

openrefine_practice_problems_explanations_fall_2026.pdf
We tried to use some fun wording for our practice problems to keep it in our space theme. The only downside was that this made it difficult to understand. This breaks down a little bit more of what the attendees need to be doing on the practice problems and provides some quick hints. We printed this sheet and left it on the attendees' desks.

slideshow.url
These are the Canva slides used during the workshop. We used them at the beginning and end of the workshop to introduce OpenRefine and give participants a challenge to work independently. They also include helpful definitions and a QR code for a library survey that asks for feedback.

openrefine_rough_lesson_plan_2026.pdf
This is the lesson plan we loosely followed throughout the workshop. There are lots of options for things to do in OpenRefine, but we recommend trying to cover all the topics covered in that plan. It should tell you everything you need to do throughout that hour.

openrefine_cheatsheet.pdf
This document is a cheat sheet of the basic tools you will teach in OpenRefine. We linked it to the GitHub page, so the attendees can look back at it once the workshop is complete.

openrefine_challenges_guide_and_solutions.txt
This is a quick breakdown of the practice problems, and it's located on GitHub; it also contains the solution that they should find.

census_and_trends_df.csv
This is a data set that goes through the number of times something was looked up per state, how many of a certain restaurant a state has, the common personality of that state, and so much more. It gives the attendees some fun data to look through.

openrefine_clustering_practice_space_df.csv
This is a file full of planet names (all coming from movies, books, and shows) and additional info on each planet. It is intentionally messy, so the attendees have something to work on cleaning. We mainly used it in our clustering practice.

star_wars_openrefine_df.csv
This data has intentional repeats of certain people, with only a slight difference in some of the columns, like a mislabeled eye color. Students have to go through and try to combine and sort as many characters as possible. This data set is a great example of needing to know something about your data before sorting it. They need to know certain attributes and characteristics about the people in this data set to be able to know which information to keep.

Additional Notes:

- If you are learning OpenRefine for the first time, these are the resources I used when I learned it:
- Using OpenRefine O'Reilly Guide: Using OpenRefine
- Intro to OpenRefine Video: Data Wrangling Made Easy: An Introduction to OpenRefine
- If you want more information on good coding practices, you can use the page below. I

recommend mentioning a couple of these during the workshop. (avoiding spaces, using clear/brief names)

- Social Sciences Coding Practices Guide: Code and Data for the Social Sciences:A Practitioner's Guide
- If you want more information about OpenRefine in the workplace from the OpenRefine page itself, you can use the following link:
- OpenRefine Site: OpenRefine 2024 User Survey Results | OpenRefine

- http://www.youtube.com/watch?v=B70J_H_zAWM (Introduction)

- http://www.youtube.com/watch?v=cO8NVCs_Ba0 (Data Transformation)

- http://www.youtube.com/watch?v=5tsyz3ibYzk (Data Augmentation)

- Cell editing | OpenRefine: this is a great resource to learn how to edit cells, doing things such as taking out trailing whitespace and changing casing

Helpful Analogies:

- When introducing facets in the workshop, you can mention that the OpenRefine icon is a faceted diamond. Like a gem, facets in OpenRefine help you see your data in a different light and from a new angle.
